Q: Keras - Using batch to avoid Keras to fit on GPU I'm trying to use Keras to fit an object detection model on GPU. The actual

---

model is quite big (>300Mb) and only a small subset of the model is used at any time (using only a handful of classes). I noticed that it uses the GPU for training itself. All weights are on GPU. The input tensor is too small to be serialized, so it does a copy from CPU to GPU after training. Does anyone know if it is possible to achieve the same with batches?

Essentially, I'd like to train some model, save it to disk, then use the saved model again later, possibly for detecting new objects. I would like to avoid the copy from CPU to GPU afterwards if at all

---

possible. I am using a GTX 1050 ti. The model is from the Tensorflow hub and can be found here. `model = load_model('model-path') model.model.load_weights(['models/model1.h5', 'models/model2.h5', 'models/model3.h5', 'models/model4.h5'])` # Feed the input to the model `model.fit(inputs, outputs, batch_size=16)` # In order to use the saved model to detect new objects with `gpu_device(0)`: `new_model = model.model.clone(device='/device:GPU:0')` `new_model.load_weights('models/model1.h5', overwrite=True)` `new_model.compile(loss='categorical_crossentropy`

---

`copy', optimizer='rmsprop')`  
`new_model.fit(X_test, y_test,`  
`batch_size=16, epochs=50)` When I try this  
code, I get the following error:  
**RuntimeError: Problem installing weights  
on GPU: Attempt to create Texture**

Classic.Effects of Lactobacillus  
acidophilus and Bifidobacterium lactis on  
Astragalus membranaceus in healthy  
women. Astragalus membranaceus is the  
most commonly used herb in China.

---

Commercial astragalus is made mainly from the roots, however, commercial roots are also contaminated with a certain amount of microorganisms. This study investigated the antimicrobial activity of a commercial astragalus on *Lactobacillus acidophilus* and *Bifidobacterium lactis*, which are the most common bacterial species found in human intestines. This study also investigated how the introduction of *Lactobacillus acidophilus* and *Bifidobacterium lactis* affected the levels of total phenolic acid in astragalus. The colony forming units (CFUs) were

---

examined when the fresh astragalus was mixed with *Lactobacillus acidophilus* and *Bifidobacterium lactis*. The levels of total phenolic acid, and polysaccharides were quantified when treated with the dried roots. *Lactobacillus acidophilus* and *Bifidobacterium lactis* were mixed with astragalus to assess the effects on the levels of the antimicrobial activity of astragalus. These are all important steps to improve the quality of astragalus. The CFU in astragalus decreased significantly when mixed with *Lactobacillus acidophilus* and *Bifidobacterium lactis* (P 1cb139a0ed
